

Boilerplate

```
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
}
```

Copy

Showing Output

It will print something to the output console.

```
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
}
```

Copy

Taking Input

It will take string input from the user

```
import java.util.Scanner;
class HelloWorld
{
    public static void main(String args[])
    {
        Scanner sc=new Scanner(System.in);
        String name=sc.nextLine();
        System.out.println(name);
    }
}
```

Copy

It will take integer input from the user

```
import java.util.Scanner;

class HelloWorld
{
    public static void main(String args[])
    {
        Scannner sc=new Scanner(System.in);
        int x=sc.nextInt();
        System.out.println(x);
    }
}
```

Copy

It will take float input from the user

```
import java.util.Scanner;

class HelloWorld
{
    public static void main(String args[])
    {
        Scannner sc=new Scanner(System.in);
        int x=sc.nextFloat();
        System.out.println(x);
    }
}
```

Copy

It will take double input from the user

```
import java.util.Scanner;

class HelloWorld
{
    public static void main(String args[])
    {
        Scannner sc=new Scanner(System.in);
        double x=sc.nextDouble();
        System.out.println(x);
    }
}
```

Copy

Primitive Type Variables

The eight primitives defined in Java are int, byte, short, long, float, double, boolean, and char those aren't considered objects and represent raw values.

byte

byte is a primitive data type it only takes up 8 bits of memory.

```
class HelloWorld
{
    public static void main(String args[])
    {
        byte age=18;
        System.out.println(age);
    }
}
```

Copy

long

long is another primitive data type related to integers. long takes up 64 bits of memory.

```
class HelloWorld
{
    public static void main(String args[])
    {
        long var=900.0;
        System.out.println(age);
    }
}
```

Copy

float

We represent basic fractional numbers in Java using the float type. This is a single-precision decimal number. Which means if we get past six decimal points, this number becomes less precise and more of an estimate.

```
class HelloWorld
{
    public static void main(String args[])
    {
```

```
float price=100.05;

System.out.println(price);

}

}
```

Copy

char

Char is a 16-bit integer representing a Unicode-encoded character.

```
class HelloWorld
{
    public static void main(String args[])
    {
        char letter='A';
        System.out.println(letter);
    }
}
```

Copy

int

int holds a wide range of non-fractional number values.

```
class HelloWorld
{
    public static void main(String args[])
    {
        int var1=256;
        System.out.println(var1);
    }
}
```

Copy

short

If we want to save memory and byte is too small, we can use short.

```
class HelloWorld
{
    public static void main(String args[])
    {
```

```
{  
    short var2=5666;  
    System.out.println(var2);  
}  
}
```

Copy

Comments

A comment is the code that is not executed by the compiler, and the programmer uses it to keep track of the code.

Single line comment

```
// It's a single line comment
```

Copy

Multi-line comment

```
/* It's a  
multi-line  
comment  
*/
```

Copy

Constants

Constants are like a variable, except that their value never changes during program execution.

```
public class Declaration {  
  
    final double PI = 3.14;  
  
    public static void main(String[] args) {  
        System.out.println("Value of PI: " + PI);  
    }  
}
```

Copy

Arithmetic Expressions

These are the collection of literals and arithmetic operators.

Addition

It can be used to add two numbers

```
public class HelloWorld
{
    public static void main(String args[])
    {
        int x=10+3;
        System.out.println(x);
    }
}
```

Copy

Subtraction

It can be used to subtract two numbers

```
public class HelloWorld
{
    public static void main(String args[])
    {
        int x=10-3;
        System.out.println(x);
    }
}
```

Copy

Multiplication

It can be used to multiply add two numbers

```
public class HelloWorld
{
    public static void main(String args[])
    {
        int x=10*3;
        System.out.println(x);
    }
}
```

Copy

Division

It can be used to divide two numbers

```
public class HelloWorld
{
    public static void main(String args[])
    {
        int x=10/3;
        System.out.println(x);
    }
}
```

Copy

Modulo Remainder

It returns the remainder of the two numbers after division

```
public class HelloWorld
{
    public static void main(String args[])
    {
        int x=10%3;
        System.out.println(x);
    }
}
```

Copy

Augmented Operators

Addition assignment

```
public class HelloWorld
{
    public static void main(String args[])
    {
        var=1;
        var+=10;
        System.out.println(var);
    }
}
```

Copy

Subtraction assignment

```
public class HelloWorld
{
    public static void main(String args[])
    {
        var=1;
        var-=10;
        System.out.println(var);
    }
}
```

Copy

Multiplication assignment

```
public class HelloWorld
{
    public static void main(String args[])
    {
        var=1;
        var*=10;
        System.out.println(var);
    }
}
```

Copy

Division assignment

```
public class HelloWorld
{
    public static void main(String args[])
    {
        var=1;
        var/=10;
        System.out.println(var);
    }
}
```

Copy

Modulus assignment

```
public class HelloWorld
{
    public static void main(String args[])
    {
        var=1;
        var%=10;
        System.out.println(var);
    }
}
```

Copy

Escape Sequences

It is a sequence of characters starting with a backslash, and it doesn't represent itself when used inside string literal.

Tab

It gives a tab space

```
public class HelloWorld
{
    public static void main(String args[])
    {
        System.out.print("\t");
    }
}
```

Copy

Backslash

It adds a backslash

```
public class HelloWorld
{
    public static void main(String args[])
    {
        System.out.print("\\");
    }
}
```

```
}
```

Copy

Single quote

It adds a single quotation mark

```
public class HelloWorld
{
    public static void main(String args[])
    {
        System.out.print("\'");
    }
}
```

Copy

Question mark

It adds a question mark

```
public class HelloWorld
{
    public static void main(String args[])
    {
        System.out.print("\?");
    }
}
```

Copy

Carriage return

Inserts a carriage return in the text at this point.

```
public class HelloWorld
{
    public static void main(String args[])
    {
        System.out.print("\r");
    }
}
```

Copy

Double quote

It adds a double quotation mark

```
public class HelloWorld
{
    public static void main(String args[])
    {
        System.out.print("\"");
    }
}
```

Copy

Type Casting

Type Casting is a process of converting one data type into another

Widening Type Casting

It means converting a lower data type into a higher

```
class HelloWorld
{
    public static void main(String args[])
    {
        int x = 45;
        double var_name = x;
        System.out.println(var_name);
    }
}
```

Copy

Narrowing Type Casting

It means converting a higher data type into a lower

```
class HelloWorld
{
    public static void main(String args[])
    {
        double x = 40005;
        int var_name = x;
    }
}
```

```
System.out.println(var_name);
```

```
}
```

```
}
```

Copy

Decision Control Statements

Conditional statements are used to perform operations based on some condition.

if Statement

```
if (condition) {
```

```
// block of code to be executed if the condition is true
```

```
}
```

Copy

if-else Statement

```
if (condition) {
```

```
// If condition is True then this block will get executed
```

```
} else {
```

```
// If condition is False then this block will get executed
```

```
}
```

Copy

if else-if Statement

```
if (condition1) {
```

```
// Codes
```

```
}
```

```
else if(condition2) {
```

```
// Codes
```

```
}
```

```
else if (condition3) {
```

```
// Codes
```

```
}
```

```
else {
```

```
// Codes
```

```
}
```

Copy

Ternary Operator

It is shorthand of an if-else statement.

Syntax

```
variable = (condition) ? expressionTrue : expressionFalse;
```

Copy

Example

```
public class TernaryOperatorExample
{
    public static void main(String args[])
    {
        int x, y;
        x = 20;
        y = (x == 1) ? 61: 90;
        System.out.println("Value of y is: " + y);
        y = (x == 20) ? 61: 90;
        System.out.println("Value of y is: " + y);
    }
}
```

Copy

Switch Statements

It allows a variable to be tested for equality against a list of values (cases).

```
class SwitchExample
{
    public static void main(String args[])
    {
        int day = 4;
        switch (day) {
            case 1:
                System.out.println("Monday");
                break;
        }
    }
}
```

```

case 2:
    System.out.println("Tuesday");
    break;
case 3:
    System.out.println("Wednesday");
    break;
case 4:
    System.out.println("Thursday");
    break;
case 5:
    System.out.println("Friday");
    break;
case 6:
    System.out.println("Saturday");
    break;
case 7:
    System.out.println("Sunday");
    break;
}
}

```

Copy

Iterative Statements

Iterative statements facilitate programmers to execute any block of code lines repeatedly and can be controlled as per conditions added by the coder.

while Loop

It iterates the block of code as long as a specified condition is True

```

public class WhileExample
{
    public static void main(String[] args)
    {
        int i=1;
        while(i<=10)
        {
            System.out.println(i);
            i++;
        }
    }
}

```

```
}  
}  
}
```

Copy

for Loop

for loop is used to run a block of code several times

```
class HelloWorld  
{  
    public static void main(String args[])  
    {  
        int i;  
        for(i=1;i<100;i++)  
        {  
            System.out.println(i);  
        }  
    }  
}
```

Copy

for-each Loop

```
public class HelloWorld  
{  
    public static void main(String args[])  
    {  
        int[] arr = {2,4,5,7,8,0,3,5}  
        for (int i : arr) {  
            System.out.println(i);  
        }  
    }  
}
```

Copy

do-while Loop

It is an exit controlled loop. It is very similar to the while loop with one difference, i.e., the body of the do-while loop is executed at least once even if the condition is False

```

public class HelloWorld
{
    public static void main(String args[])
    {
        int i=1;
        do
        {
            System.out.println(i);
            i++;
        }while(i<=100);
    }
}

```

Copy

Break statement

break keyword inside the loop is used to terminate the loop

```

class HelloWorld
{
    public static void main(String args[])
    {
        int i;
        for(i=1;i<100;i++)
        {
            System.out.println(i);
            if(i==50)
            break;
        }
    }
}

```

Copy

Continue statement

continue keyword skips the rest of the current iteration of the loop and returns to the starting point of the loop

```

class HelloWorld

```

```
{  
    public static void main(String args[])  
    {  
        int i;  
        for(i=1;i<100;i++)  
        {  
            System.out.println(i);  
            if(i==50)  
                continue;  
        }  
    }  
}
```

Copy

Arrays

Arrays are used to store multiple values in a single variable

Declaring an array

Declaration of an array

```
public class HelloWorld  
{  
    public static void main(String args[])  
    {  
        String [] var_name;  
    }  
}
```

Copy

Defining an array

Defining an array

```
public class HelloWorld  
{  
    public static void main(String args[])  
    {  
        String [] var_name={"harry","rohan","aakash"}  
    }  
}
```

```
}
```

```
}
```

Copy

Accessing an array

Accessing the elements of an array

```
public class HelloWorld
```

```
{
```

```
    public static void main(String args[])
```

```
    {
```

```
        String[] var_name = {'Harry', 'Rohan', 'Aakash'};
```

```
        System.out.println(var_name[index]);
```

```
    }
```

```
}
```

Copy

Changing an element

Changing any element in an array

```
public class HelloWorld
```

```
{
```

```
    public static void main(String args[])
```

```
    {
```

```
        String[] var_name = {'Harry', 'Rohan', 'Aakash'};
```

```
        var_name[2]="Shubham";
```

```
    }
```

```
}
```

Copy

Array length

It gives the length of the array

```
public class HelloWorld
```

```
{
```

```
    public static void main(String args[])
```

```
    {
```

```
        System.out.println(var_name.length);
```

```
}
```

```
}
```

Copy

Loop through an array

It allows us to iterate through each array element

```
public class HelloWorld
{
    public static void main(String args[])
    {
        String[] var_name = {'Harry', 'Rohan', 'Aakash'};
        for (int i = 0; i < var_name.length; i++) {
            System.out.println(var_name[i]);
        }
    }
}
```

Copy

Multi-dimensional Arrays

Arrays can be 1-D, 2-D or multi-dimensional.

```
// Creating a 2x3 array (two rows, three columns)
int[2][3] matrix = new int[2][3];
matrix[0][0] = 10;
// Shortcut
int[2][3] matrix = {
{ 1, 2, 3 },
{ 4, 5, 6 }
};
```

Copy

Methods

Methods are used to divide an extensive program into smaller pieces. It can be called multiple times to provide reusability to the program.

Declaration

Declaration of a method

```
returnType methodName(parameters) {  
    //statements  
}
```

Copy

Calling a method

Calling a method

```
methodName(arguments);
```

Copy

Example

```
public static void findEvenOdd(int num)  
{  
    //method body  
    if(num%2==0)  
        System.out.println(num+" is even");  
    else  
        System.out.println(num+" is odd");  
}  
  
import java.util.Scanner;  
  
public class EvenOdd  
{  
    public static void main (String args[])  
    {  
        //creating Scanner class object  
        Scanner scan=new Scanner(System.in);  
        System.out.print("Enter the number: ");  
        //reading value from the user  
        int num=scan.nextInt();  
        //method calling  
        findEvenOdd(num);  
    }  
}
```

Copy

Method Overloading

Method overloading means having multiple methods with the same name, but different parameters.

```

class Calculate
{
    void sum (int x, int y)
    {
        System.out.println("Sum is: "+(a+b)) ;
    }
    void sum (float x, float y)
    {
        System.out.println("Sum is: "+(a+b));
    }
    public static void main (String[] args)
    {
        Calculate calc = new Calculate();
        calc.sum (5,4); //sum(int x, int y) is method is called.
        calc.sum (1.2f, 5.6f); //sum(float x, float y) is called.
    }
}

```

Copy

Recursion

Recursion is when a function calls a copy of itself to work on a minor problem. And the function that calls itself is known as the Recursive function.

```

void recurse()
{
    recurse();
}

```

Copy

Strings

It is a collection of characters surrounded by double quotes.

Creating String Variable

```

String var_name = "Hello World";

```

Copy

String Length

Returns the length of the string

```
public class str
{
    public static void main(String args[])
    {
        String var_name = "Harry";
        System.out.println("The length of the string is: " + var_name.length());
    }
}
```

Copy

String Methods toUpperCase()

Convert the string into uppercase

```
public class str
{
    public static void main(String args[])
    {
        String var_name = "Harry";
        System.out.println(var_name.toUpperCase());
    }
}
```

Copy

toLowerCase()

Convert the string into lowercase

```
public class str
{
    public static void main(String args[])
    {
        String var_name = "Harry";
        System.out.println(var_name.toLowerCase());
    }
}
```

Copy

indexOf()

Returns the index of specified character from the string

```

public class str
{
    public static void main(String args[])
    {
        String var_name = "Harry";
        System.out.println(var_name.indexOf("a"));
    }
}

```

Copy

concat()

Used to concatenate two strings

```

public class str
{
    public static void main(String args[])
    {
        String var1 = "Harry";
        String var2 = "Bhai";
        System.out.println(var1.concat(var2));
    }
}

```

Copy

Math Class

Math class allows you to perform mathematical operations.

Methods max() method

It is used to find the greater number among the two

```

public class Demo
{
    public static void main(String[] args)
    {
        // using the max() method of Math class
        System.out.print("The maximum number is: " + Math.max(9,7));
    }
}

```

Copy

min() method

It is used to find the smaller number among the two

```
public class Demo
{
    public static void main(String[] args)
    {
        // using the min() method of Math class
        System.out.print("The maximum number is: " + Math.min(9,7));
    }
}
```

Copy

sqrt() method

It returns the square root of the supplied value

```
public class Demo
{
    public static void main(String[] args)
    {
        // using the sqrt method of Math class
        System.out.print("The maximum number is: " + Math.sqrt(144));
    }
}
```

Copy

random() method

It is used to generate random numbers

```
Math.random(); //It will produce random number b/w 0.0 and 1.0
```

Copy

```
public class Demo
{
    public static void main(String[] args)
    {
        // using the random() method of Math class
```

```
int random_num = (int)(Math.random() * 101); //Random num b/w 0 and 100
System.out.println(random_num);
}
}
```

Copy

Object-Oriented Programming

It is a programming approach that primarily focuses on using objects and classes. The objects can be any real-world entities.

class

A class can be defined as a template/blueprint that describes the behavior/state that the object of its type support.

```
class ClassName {
// Fields
// Methods
// Constructors
// Blocks
}
```

Copy

object of class

An object is an instance of a Class.

```
className object = new className();
```

Copy

Encapsulation

Encapsulation is a mechanism of wrapping the data and code acting on the data together as a single unit. In encapsulation, the variables of a class will be hidden from other classes and can be accessed only through the methods of their current class.

```
public class Person
{
private String name; // using private access modifier

// Getter
public String getName()
{
```

```

    return name;
}

// Setter
public void setName(String newName)
{
    this.name = newName;
}
}

```

Copy

Inheritance

Inheritance can be defined as the process where one class acquires the properties of another. With the use of inheritance the information is made manageable in a hierarchical order.

```

class Subclass-name extends Superclass-name
{
    //methods and fields
}

```

Copy

Example

```

class Employee
{
    float salary=40000;
}

class Programmer extends Employee
{
    int bonus=10000;

    public static void main(String args[])
    {
        Programmer p=new Programmer();
        System.out.println("Programmer salary is:"+p.salary);
        System.out.println("Bonus of Programmer is:"+p.bonus);
    }
}

```

Copy

Polymorphism

Polymorphism is the ability of an object to take on many forms. The most common use of polymorphism in OOP occurs when a parent class reference is used to refer to a child class object.

```
// A class with multiple methods with the same name
public class Adder
{
    // method 1
    public void add(int a, int b)
    {
        System.out.println(a + b);
    }

    // method 2
    public void add(int a, int b, int c)
    {
        System.out.println(a + b + c);
    }

    // method 3
    public void add(String a, String b)
    {
        System.out.println(a + " + " + b);
    }
}

// My main class
class MyMainClass
{
    public static void main(String[] args)
    {
        Adder adder = new Adder(); // create a Adder object
        adder.add(5, 4); // invoke method 1
        adder.add(5, 4, 3); // invoke method 2
        adder.add("5", "4"); // invoke method 3
    }
}
```

```
}
```

Copy

File Operations

File handling refers to reading or writing data from files. Java provides some functions that allow us to manipulate data in the files.

Assume that we have created the file “D:\\Example.txt”

canRead method

Checks whether the file is readable or not

```
import java.io.*;

public class FileOperations {
    public static void main(String args[])
    {

        // Get the file
        File f = new File("D:\\Example.txt");

        // Check if the specified file
        // can be read or not
        if (f.canRead())
            System.out.println("Can be Read");
        else
            System.out.println("Cannot be Read");
    }
}
```

Copy

createNewFile method

It creates an empty file

```
import java.io.*;

public class FileOperations
{
    public static void main(String args[])
    {
```

```

try {

    // Get the file
    File f = new File("D:\\Example.txt");

    // Create new file
    // if it does not exist
    if (f.createNewFile())
        System.out.println("File created");
    else
        System.out.println("File already exists");
    }
    catch (Exception e) {
        System.err.println(e);
    }
}
}

```

Copy

canWrite method

Checks whether the file is writable or not

```

import java.io.*;

public class FileOperations {
    public static void main(String args[])
    {

        // Get the file
        File f = new File("D:\\Example.txt");

        // Check if the specified file
        // can be written or not
        if (f.canWrite())
            System.out.println("Can be written");
        else
    }
}

```

```
System.out.println("Cannot be written");
```

```
}
```

```
}
```

Copy

exists method

Checks whether the file exists

```
import java.io.*;
```

```
// Main class
```

```
public class FileOperations {
```

```
    public static void main(String args[])
```

```
{
```

```
        File f = new File("D:\\Example.txt");
```

```
        // Checking if the specified file exists or not
```

```
        if (f.exists())
```

```
            // Show if the file exists
```

```
            System.out.println("Exists");
```

```
        else
```

```
            // Show if the file does not exists
```

```
            System.out.println("Does not Exists");
```

```
    }
```

```
}
```

Copy

delete method

It deletes a file

```
import java.io.*;
```

```
public class FileOperations {
```

```
    public static void main(String[] args)
```

```
{
```

```
File file= new File("D:\\Example.txt");
```

```
if (file.delete()) {
```

```
    System.out.println("File deleted successfully");
```

```
}
```

```
else {
```

```
    System.out.println("Failed to delete the file");
```

```
}
```

```
}
```

```
}
```

Copy

getName method

It returns the name of the file

```
import java.io.*;
```

```
public class FileOperations {
```

```
    public static void main(String args[])
```

```
{
```

```
    // try-catch block to handle exceptions
```

```
    try {
```

```
        // Create a file object
```

```
        File f = new File("D:\\Example.txt");
```

```
        // Get the Name of the given file f
```

```
        String Name = f.getName();
```

```
        // Display the file Name of the file object
```

```
        System.out.println("File Name : " + Name);
```

```
    }
```

```
    catch (Exception e) {
```

```
        System.err.println(e.getMessage());
```

```
    }
```

```
}
```

```
}
```

Copy

getAbsolutePath method

It returns the absolute pathname of the file

```
import java.io.*;

public class FileOperations {
    public static void main(String args[])
    {

        // try-catch block to handle exceptions
        try {

            // Create a file object
            File f = new File("Example.txt");

            // Get the absolute path of file f
            String absolute = f.getAbsolutePath();

            // Display the file path of the file object
            // and also the file path of absolute file
            System.out.println("Original path: " + f.getPath());
            System.out.println("Absolute path: "+ absolute);
        }
        catch (Exception e) {
            System.err.println(e.getMessage());
        }
    }
}
```

Copy

length Method

It returns the size of the file in bytes

```
import java.io.*;
```

```

public class FileOperations {
    public static void main(String args[])
    {

        // Get the file
        File f = new File("D:\\Example.txt");

        // Get the length of the file
        System.out.println("length: " + f.length());
    }
}

```

Copy

list Method

It returns an array of the files in the directory

```

import java.io.*;

public class FileOperations {
    public static void main(String args[])
    {

        // try-catch block to handle exceptions
        try {

            // Create a file object
            File f = new File("f:\\Examples");

            // Get all the names of the files present
            // in the given directory
            String[] files = f.list();

            System.out.println("Files are:");

            // Display the names of the files
            for (int i = 0; i < files.length; i++) {
                System.out.println(files[i]);
            }
        }
    }
}

```

```

    }
}
    catch (Exception e) {
        System.err.println(e.getMessage());
    }
}
}
}
}

```

Copy

mkdir method

It is used to create a new directory

```

import java.io.*;

public class FileOperations {

    public static void main(String args[])
    {
        // create an abstract pathname (File object)
        File f = new File("D:\\program");

        // check if the directory can be created
        // using the abstract path name
        if (f.mkdir()) {

            // display that the directory is created
            // as the function returned true
            System.out.println("Directory is created");
        }
        else {
            // display that the directory cannot be created
            // as the function returned false
            System.out.println("Directory cannot be created");
        }
    }
}

```

Copy

close method

It is used to close the file

```
import java.io.File;
import java.io.FileInputStream;

public class FileOperations {

    public static void main(String[] args)
    {

        // Creating file object and specifying path
        File file = new File("file.txt");

        try {
            FileInputStream input= new FileInputStream(file);
            int character;
            // read character by character by default
            // read() function return int between
            // 0 and 255.

            while ((character = input.read()) != -1) {
                System.out.print((char)character);
            }

            input.close();
            System.out.println("File is Closed");
            System.out.println(
                "Now we will again try to read");
            while ((character = input.read()) != -1) {
                System.out.print((char)character);
            }
        }
        catch (Exception e) {
            System.out.println(
                "File is closed. Cannot be read");
            e.printStackTrace();
        }
    }
}
```

```
}
```

```
}
```

Copy

To write something in the file

```
import java.io.FileWriter; // Import the FileWriter class
import java.io.IOException; // Import the IOException class to handle errors

public class WriteToFile
{
    public static void main(String[] args) {
        try
        {
            FileWriter myWriter = new FileWriter("filename.txt");
            myWriter.write("Laal Phool Neela Phool, Harry Bhaiya Beautiful");
            myWriter.close();

            System.out.println("Successfully wrote to the file.");
        }
        catch (IOException e)
        {
            System.out.println("An error occurred.");
            e.printStackTrace();
        }
    }
}
```

Copy

Exception Handling

An exception is an unusual condition that results in an interruption in the flow of the program.

try-catch block

try statement allow you to define a block of code to be tested for errors. catch block is used to handle the exception.

```
try {
    // Statements
}
catch(Exception e) {
```

```
// Statements
```

```
}
```

Copy

Example

```
class Main {  
    public static void main(String[] args) {  
  
        try {  
            int divideByZero = 5 / 0;  
            System.out.println("Rest of code in try block");  
        }  
  
        catch (ArithmeticException e) {  
            System.out.println("ArithmeticException => " + e.getMessage());  
        }  
    }  
}
```

Copy

finally block

finally code is executed whether an exception is handled or not.

```
try {  
    //Statements  
}  
catch (ExceptionType1 e1) {  
    // catch block  
}  
finally {  
    // finally block always executes  
}
```

Copy

Example

```
class Main {
```

```
public static void main(String[] args) {  
    try {  
        int divideByZero = 5 / 0;  
    }  
  
    finally {  
        System.out.println("Finally block is always executed");  
    }  
}  
}
```

Copy
